

Transforming Discoveries into Products: *Maximizing NIH's Levers to Catalyze Technology Transfer*

How NIH Negotiates License Terms

Tara L. Kirby, Ph.D.

Director, Office of Technology Transfer
Office of Intramural Research, Office of the Director
National Institutes of Health

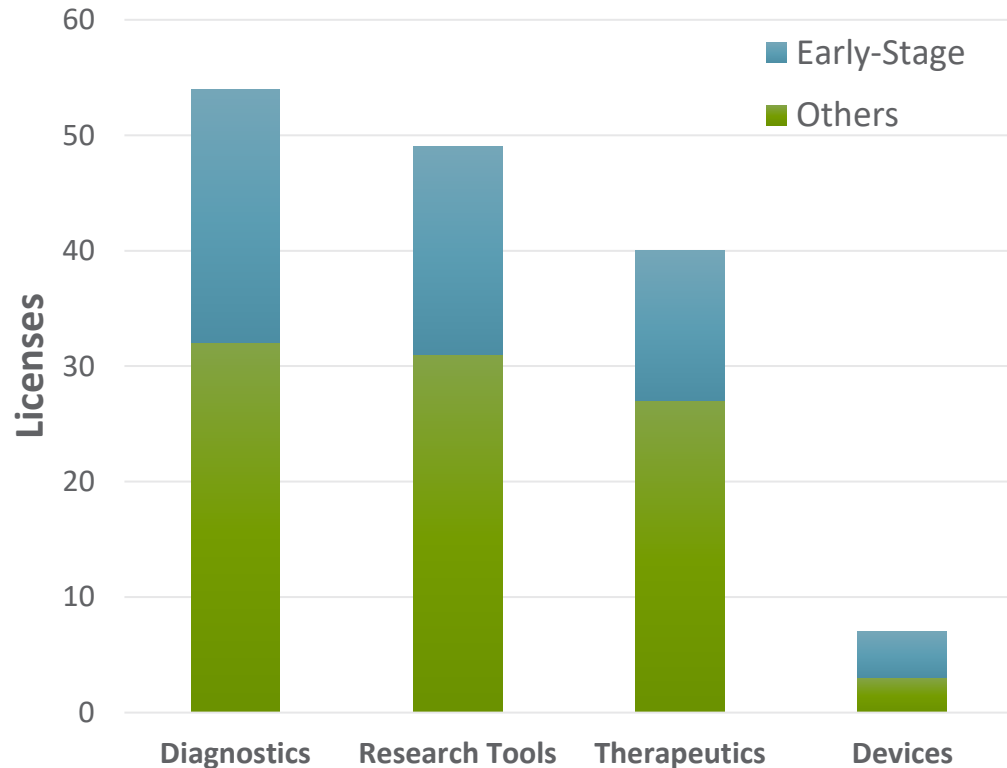

National Institutes of Health
Turning Discovery Into Health

NIH Licenses Yield Substantial Public Health Benefits

- Broad range of technologies reflecting intramural program's diverse research
- More than 1,000 products brought to market
39 FDA-approved vaccines and therapeutics
- Licensed IP utilized in over 1,200 clinical trials
- Over 60% of NIH licenses are for research tools
- Most licenses are non-exclusive

Who Licenses NIH Technologies?

- Not just big companies!
- About 1/3 of NIH's most successful technologies were licensed by early-stage companies.
- Overall, for every 2 U.S. licensees there is 1 foreign licensee.

Legal Framework for NIH Licensing

- 35 U.S.C. § 207-209
 - Domestic and foreign protection of federally owned inventions
- 37 C.F.R. § 404
 - Licensing of Government-owned Inventions

37 C.F.R. § 404 – Licensing Blueprint

Addresses:

- Information that applicants need to provide
- What kinds of licenses the Government can grant
- Restrictions and conditions on all licenses
- Special requirements for exclusive licenses
- Government right to terminate or modify

NIH Licensing Goals

- “It is the policy and objective of this subpart to promote the results of federally funded research and development through the patenting and licensing process.”
- What does this mean?
 - Utilize IP appropriately as incentive for commercial development of technologies
 - Attract new R&D resources
 - Obtain return on public investment
 - Stimulate economic development

And:

Benefit the public health

NIH Licensing Principles

- Grant only the appropriate scope of rights
- Specified fields of use
- Preference for non- or partial exclusivity
- Permit research uses
- Enforceable milestones and benchmarks
- Maximize development of products for the public health
- Ensure appropriate return on public investment

Challenge: Licensing Early-Stage Technologies

- Often 10-15 years from executed license to marketed product
- How to determine most effective licensing strategy?
 - Market may not yet exist
 - Regulatory landscape may change (or be unknown)
 - Who will need it most?
 - Where to seek patent protection?
 - Patents may expire before product even comes to market
 - Is the licensee the company that will eventually market the product?
 - What kind of licenses will be needed? Exclusive, non-exclusive, both?

Starting Point for Negotiations

- Information from applicants
 - Development, marketing plans required as part of application
- Comparables
 - Similar licenses that NIH has done before
- Market research/valuations
 - But can be highly speculative for early-stage technologies
- What we don't use:
 - Inventor input, particularly on financial terms

Negotiating the Terms

- Financials are just one part of the puzzle
- Scope of license grant (exclusivity, patents, products, territory?)
- Development timeline and associated benchmarks
- Reporting and other diligence requirements
- Sublicensing requirements
- Public benefit (“White Knight”) provisions

Examples of “White Knight” Terms

- Supply back of Licensed Products or Services
- Health education programs (web or print)
- Indigent access programs for Licensed Products
- Developing country access for Licensed Products
- Biodiversity compliance for natural products

Financial Terms

- Based on multiple factors
- Usually includes:
 - Upfront fee
 - Earned royalties on sales
 - Milestone payments
 - Sublicensing payments
 - Patent expenses
- For technologies that are high risk (e.g., early stage), payments generally shifted towards the “back end” - we succeed when licensee succeeds
- Also take into account licensee resources - terms should not hinder ability to develop and market the technology
- Other, non-financial terms also part of the equation

Tracking Licensee Progress

- Executing a license is the start of a multi-year relationship
- NIH has to ensure that the licensee holds up its end of the bargain
- How? Through periodic review of things like
 - Progress reports
 - Benchmarks
 - Payments
 - Review of public information
- License includes variety of levers for NIH to use if licensee is not performing

When There's a Problem

- Risky early-stage technologies mean plans can get derailed
- Often best option is to amend the license
 - Appropriate if license is diligent but needs help getting back on track
 - NIH can modify requirements, terms in exchange for flexibility
 - Revisit scope of license - has the situation changed?

- Warning signs

- Seems unable to move technology forward
- May be "shelving" the technology
- Lack of communication and/or failure to provide required reports

- Last resort: license termination

- Risk: technology will not be developed
- Licensee on the hook for unpaid obligations
- May impact ability to obtain other licenses, or work with the NIH at all.

Other NIH Strategies for Facilitating Access

- Participation in patent pools
 - Medicines Patent Pool (HIV medicines)
 - MPEG LA/Librassay[®] (diagnostic technologies)
 - WHO COVID-19 Technology Access Pool (vaccines)
- Special license models
 - Non-Profit Licenses (for vaccines, therapeutics related to NTDs)
 - Start-Up Licenses (for vaccines, therapeutics & certain devices, largely deferred financial terms)

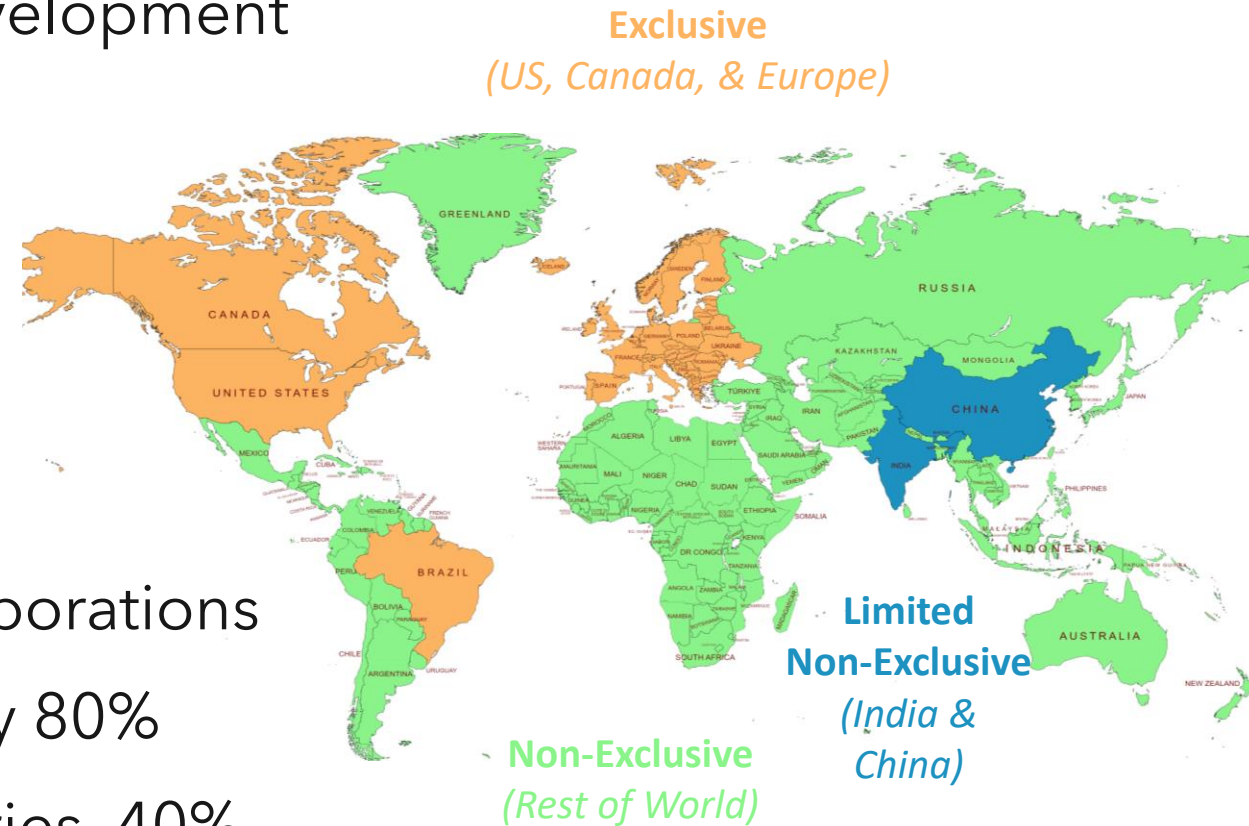

Snapshot: Regional Licensing to Facilitate Access

- Rotavirus is a highly contagious virus that can cause severe diarrhea and vomiting, especially in infants.
- Before a vaccine was available, rotavirus was responsible for half a million child deaths each year
- Previous vaccine efforts failed, leading to NIH development of a 2nd generation vaccine

Snapshot: Regional Licensing to Facilitate Access

- Maximize opportunity for successful development and global distribution of technology
 - 14 commercial licensees
 - Biological materials
 - Access to inventor for technical input
 - Regional expertise
 - Regional vaccine programs
- Establish relationships and enable collaborations
- Result in US: hospitalizations reduced by 80%
- ROW: available in more than 100 countries, 40% decrease in hospital admissions for young children, reduced deaths

Public Health & Economic Impact Study

May 2023

Technology Transfer and Licensing at the U.S. National Institutes of Health

Source: *Public Health & Economic Impact Study of NIH Intramural Technology Transfer Licensing*

The background of the slide is a complex, abstract geometric pattern. It features a network of thin, light blue lines connecting various nodes, some of which are small circles or squares. Larger, semi-transparent shapes in shades of blue and yellow are scattered throughout, creating a sense of depth and movement. The overall aesthetic is clean, modern, and technical.

Thank you!
